

Final Report Criteria

1. Introduction

- Domain description
- Current system and limitations
- Goal & objectives
- Process re-engineered
- Assumptions, if any

2. Feasibility Study

3. Requirements

- Stakeholders / Actors
- Functional and Non-Requirements
- In-scope and out-scope
- Constraints and limitations, if any

4. System's Architecture

- Components and their functionalities
- Component interactions

5. System Design Diagrams

- Use case diagram
- Class diagram
- ER diagram
- Activity diagrams

6. Completeness of the Project

- Functionalities completed
- Functionalities yet to complete
- Individual contribution of the team members;

Mention the functionalities completed by the member, **including the test cases.**

Mention each member's individual contribution as a **percentage.**

Final Report

1. Introduction

1.1 Domain Description

CareerSync operates within the career and internship management domain, focusing on streamlining communication and coordination among students, career counselors, company HR representatives, validation teams, and administrators. The system serves as a centralized digital platform designed to manage internship and career opportunities, career guidance, and recruitment-related processes efficiently within an academic or organizational environment. Its core mission is to create a seamless, transparent, and efficient ecosystem for all stakeholders involved in the journey from opportunity discovery to successful placement.

1.2 Current System and Limitations

Currently, the management of internships and placements in most institutions and companies relies on a fragmented mix of manual and semi-digital systems. Common methods include the use of emails, shared spreadsheets, and physical forms for posting opportunities, submitting applications, and managing approvals.

These existing approaches present several critical limitations:

Lack of Centralization: Data is scattered across multiple platforms (e.g., emails, personal drives), leading to confusion, duplication of effort, and difficulty in maintaining a single source of truth.

Poor Process Tracking: There is no unified way to track the progress of an application, from submission to interview scheduling and final selection. This lack of visibility causes delays and uncertainty for both students and recruiters.

Fragmented Communication: Interactions between counselors, HR personnel, and students are disjointed, often occurring in silos and making effective collaboration difficult.

Inefficient Verification: The manual verification of student documents and company credentials by validation teams is a time-consuming, labor-intensive, and error-prone process.

Limited Guidance: Most job seekers or interns are hesitant to seek out career counseling which could lead to

1.3 Goal & Objectives

The primary goal of CareerSync is to digitize, automate, and streamline the entire career and internship management lifecycle, creating a single, integrated platform that enhances efficiency, transparency, and user experience for all parties involved.

Objectives include:

- To provide a centralized platform where students can discover, apply for, and track the status of internships and job opportunities.
- To equip career counselors with tools to guide students and schedule counseling sessions.
- To empower company HR representatives with the ability to post opportunities, manage incoming applications, and coordinate interview schedules efficiently.
- To support a validation team with a structured workflow for verifying the authenticity of student documents and company profiles.
- To implement a role-based dashboard system that provides each stakeholder with a customized view of relevant information and actions.

1.4 Process Re-engineered

The implementation of CareerSync fundamentally re-engineers the existing manual processes. Instead of a linear, disconnected workflow, the system introduces a parallel and integrated process:

- **Automated Workflows:** The system automates notifications and status updates, moving from manual email chains to automated alerts (e.g., "Application Received," "Interview Scheduled").

- Centralized Data Management: All user profiles, job postings, applications, and validation records are stored in a single database, eliminating data silos and ensuring consistency.
- Role-Based Access: The system enforces distinct workflows for each actor. For example, a student can only view and apply for jobs, while a validator has a specific interface for approving documents.
- Digital Validation: The manual verification process is replaced with a digital queue where validators can efficiently review and approve documents and registrations.

1.5 Assumptions

All users possess basic computer literacy and are familiar with using web-based applications.

Users have access to a stable internet connection to utilize the platform effectively.

All participating organizations and students will have their identities verified through an initial registration process before being granted full access to the platform's features.

2. Feasibility Study

2.1 Technical Feasibility

The project is technically feasible, utilizing a standard and robust web-based technology stack. The front-end is developed using HTML, CSS, and JavaScript, ensuring compatibility with all major web browsers. The back-end is powered by PHP, with MySQL serving as the relational database management system. The choice of no external frameworks (except for the payment gateway) for the front-end simplifies the architecture, making the system easier to maintain, debug, and deploy on standard, cost-effective hosting environments.

2.2 Operational Feasibility

CareerSync is designed with an intuitive, user-friendly interface that aligns closely with the existing operational workflows of academic institutions and corporate HR departments. The multi-role architecture ensures that each user group is presented with only the tools and information relevant to their responsibilities. The need for extensive training is minimal, as core actions such as searching for jobs, posting listings, and scheduling interviews are self-explanatory. The system is designed to be adopted seamlessly into the daily routines of counselors, students, and HR personnel.

2.3 Economic Feasibility

The project is economically viable. The development is based entirely on open-source technologies (PHP, MySQL, HTML/CSS/JS), incurring no licensing costs. Deployment requires only a standard web server (e.g., XAMPP) and a database server, which can be hosted on existing institutional infrastructure or on low-cost cloud platforms. The long-term economic benefits include significant savings from reduced administrative overhead, minimized paper usage, and the automation of previously manual, time-consuming tasks, allowing staff to focus on higher-value activities.

2.4 Schedule Feasibility

The project has been planned and executed within the constraints of the one-year academic timeframe. As outlined in the interim report, the user interface was completed in the initial phase, and the backend development is well underway. The project is currently completed, with the only remaining task is to incorporate the system to an actual domain instead of running the server in a local machine. The modular MVC architecture has facilitated parallel development, contributing to the schedule's feasibility.

3. Requirements

3.1 Stakeholders / Actors

The following stakeholders have been identified for the CareerSync system:

- **Student / Job-seeker:** The primary user who creates a profile, uploads their CV, searches for and applies to job/internship listings, and tracks the status of their applications.
- **Career Counselor:** A faculty or staff member who reviews student profiles and applications, provides career guidance in scheduled counseling sessions, and may approve applications based on institutional requirements.
- **Company HR:** A representative from a partner organization who manages the company profile, posts new job/internship opportunities, reviews incoming applications, and schedules interviews with shortlisted candidates.
- **Validation Team:** An administrative body that can consist of one or more members responsible for verifying the authenticity of student-submitted documents (e.g., transcripts, ID cards) and ensuring the legitimacy of newly registered company profiles before they can fully utilize the platform.
- **Admin:** The system administrator with overarching privileges to manage all user roles, configure system settings, oversee data backups, view system logs, receive security alerts, generate system-wide reports, and ensure the overall health and security of the platform.

3.2 Functional Requirements

The system must provide the following core functionalities:

- **User Management:** Secure registration and authentication with role-based access control for all five user types.
- **Profile Management:** Comprehensive profile creation and editing capabilities for students, companies, and counselors.
- **Job/Internship Management:** A system for HR to post, edit, and close listings, and for students to view and apply to them.
- **Application Lifecycle:** A mechanism to track the status of applications (e.g., Applied, Shortlisted, Rejected, Hired).
- **Interview Scheduling:** An interface for HR to propose interview slots and for students to confirm them, with calendar integration.
- **Document & Profile Validation:** A dedicated interface for the validation team to review and approve student documents and company registrations.
- **Notification System:** An automated system to send alerts (in-app and via email) for events like new job postings, application updates, interview invitations, and pending validations.
- **Counseling Module:** A feature for students to request counseling sessions and for counselors to manage their schedules and provide feedback.
- **Administrative Dashboard:** A dashboard for the admin to view system analytics, manage users, and access reports.

3.3 Non-Functional Requirements

The system must adhere to the following quality attributes:

- **Usability:** Provide a responsive and intuitive user interface that is consistent across all devices (desktop, mobile).

- **Security:** Implement secure login mechanisms (e.g., password hashing), role-based access control, and protect against common web vulnerabilities (e.g., SQL injection).
- **Reliability:** Ensure high system availability with reliable database performance.
- **Scalability:** The architecture should be designed to handle an increased number of users, job postings, and applications to support potential future institution-wide deployment.
- **Performance:** System response times for critical operations like searching for jobs or submitting an application should be minimal to ensure a smooth user experience.
- **Maintainability:** The MVC architecture and clean, well-commented code should make the system easy to maintain and extend in the future.

3.4 In-Scope

The final system will include:

Development of all user interface screens for each of the five roles.

Full implementation of backend logic for user management, job posting, application handling, and validation workflows.

Complete integration between the front-end and the MySQL database for all in-scope features.

Implementation of the automated notification system for core events.

3.5 Out-of-Scope

The following features are considered out-of-scope for this project:

Third-party integrations (e.g., LinkedIn profile import, external job board APIs).

A native mobile application (the system is designed to be a web-based application only).

Advanced analytics and machine learning-based recommendation systems (planned for future iterations).

3.6 Constraints and Limitations

The system will be subject to the following constraints:

- Platform: The system is designed to function as a web application and is limited to operation within a web browser; there is no native mobile app version.
- Infrastructure: Its performance and availability are inherently dependent on the reliability of the server and the user's internet connectivity.
- Resource Limitations: Initial deployment is designed for moderate scale. Large-scale deployment with thousands of concurrent users would require a more robust server infrastructure than the standard hosting environment used during development.

4. Proposed System's Architecture

CareerSync follows the **Model–View–Controller (MVC)** architectural pattern to ensure separation of concerns, scalability, and maintainability of the system.

4.1 Model

The Model layer is responsible for handling all data-related logic and interactions with the database.

- Implements PHP classes that directly communicate with the MySQL database
- Handles CRUD operations (Create, Read, Update, Delete)
- Ensures data validation and integrity before database transactions

Key Model Components:

- **admin.php :**
Includes the functions required to fetch data that are useful for the admin dashboard.
- **adminReportDetails.php :**
Includes the functions required to fetch data that would go in the admin report.
- **Bookmark.php :**
Fetches the data from the database about jobPosts that are bookmarked by candidates.
- **candidate.php :**
Includes the functions required to fetch data that are useful for the candidate dashboard.
- **company.php :**
Includes the functions required to fetch data that are useful for the company dashboard.
- **consultation.php :**
Fetches the details relevant to meetings that are scheduled to be held between the counselor and candidate.
- **consultationRequest.php :**
Fetches the requests made by a candidate to a counselor asking for a date/dates to schedule a meeting.
- **consultationSlot.php :**
Fetches the time/date slots offered for a meeting by the counselor to the candidate.

- **counselor.php :**
Includes the functions required to fetch data that are useful for the candidate dashboard.
- **cv.php :**
Fetches the CV data of cv's that are sent to companies by the candidates.
- **interview.php :**
Fetches the details relevant to meetings that are scheduled to be held between the company HR and candidate.
- **interviewSlot.php :**
Fetches the time/date slots offered for a meeting by the company HR to the candidate.
- **jobPost.php :**
Fetches the data about the job details that are posted by the company from the database.
- **message.php :**
Fetches the data about messages sent throughout the website from the database
- **User.php :**
Fetches all the user details such as email, role , hashed_password, dateOfCreation and user_id
- **validator.php :**
Includes the functions required to fetch data that are useful for the validator dashboard.

4.2 View

The View layer is responsible for presenting data to the user through the UI.

- Built using **HTML, CSS, and JavaScript**
- Provides **role-based dashboards** (Candidate, Company, Counselor, Validator, Admin)
- Ensures responsive design for mobile and desktop screen sizes
- Focuses on usability and intuitive navigation

Examples:

- Candidate dashboard (applications, CV upload, tracking)
- Company dashboard (job posting, applicant management)
- Counselor interface (interface to schedule meetings with students)
- Validator Dashboard (checking the legitimacy and approving or rejecting newly registered companies or candidate CV's)

- Admin Dashboard (Report Generation, user management, viewing feedback and alerts)
- Registration View (provides registration form specialized for each role)
- Home view/landing page (lists the jobs along with the filters that can be applied to them)
- About us page view (provides a brief description about the website)
- Contact us page view (provides the interface for users to give feedback/complaints directly to the admin)

4.3 Controller

The Controller acts as the intermediary between Model and View.

- Processes user inputs and HTTP requests
- Calls appropriate Model functions
- Sends processed data to the View

Responsibilities:

- Authentication and session management
- Routing user requests
- Enforcing role-based access control
- Handling business logic

Some Examples:

- candidateDash_controller.php
- companyDash_controller.php
- counselorDash_controller.php
- adminDash_controller.php
- validatorDash_controller.php
- Core controllers (App.php, Controller.php, Database.php, config.php, functions.php, init.php, mailer.php, model.php, systemLogger.php)

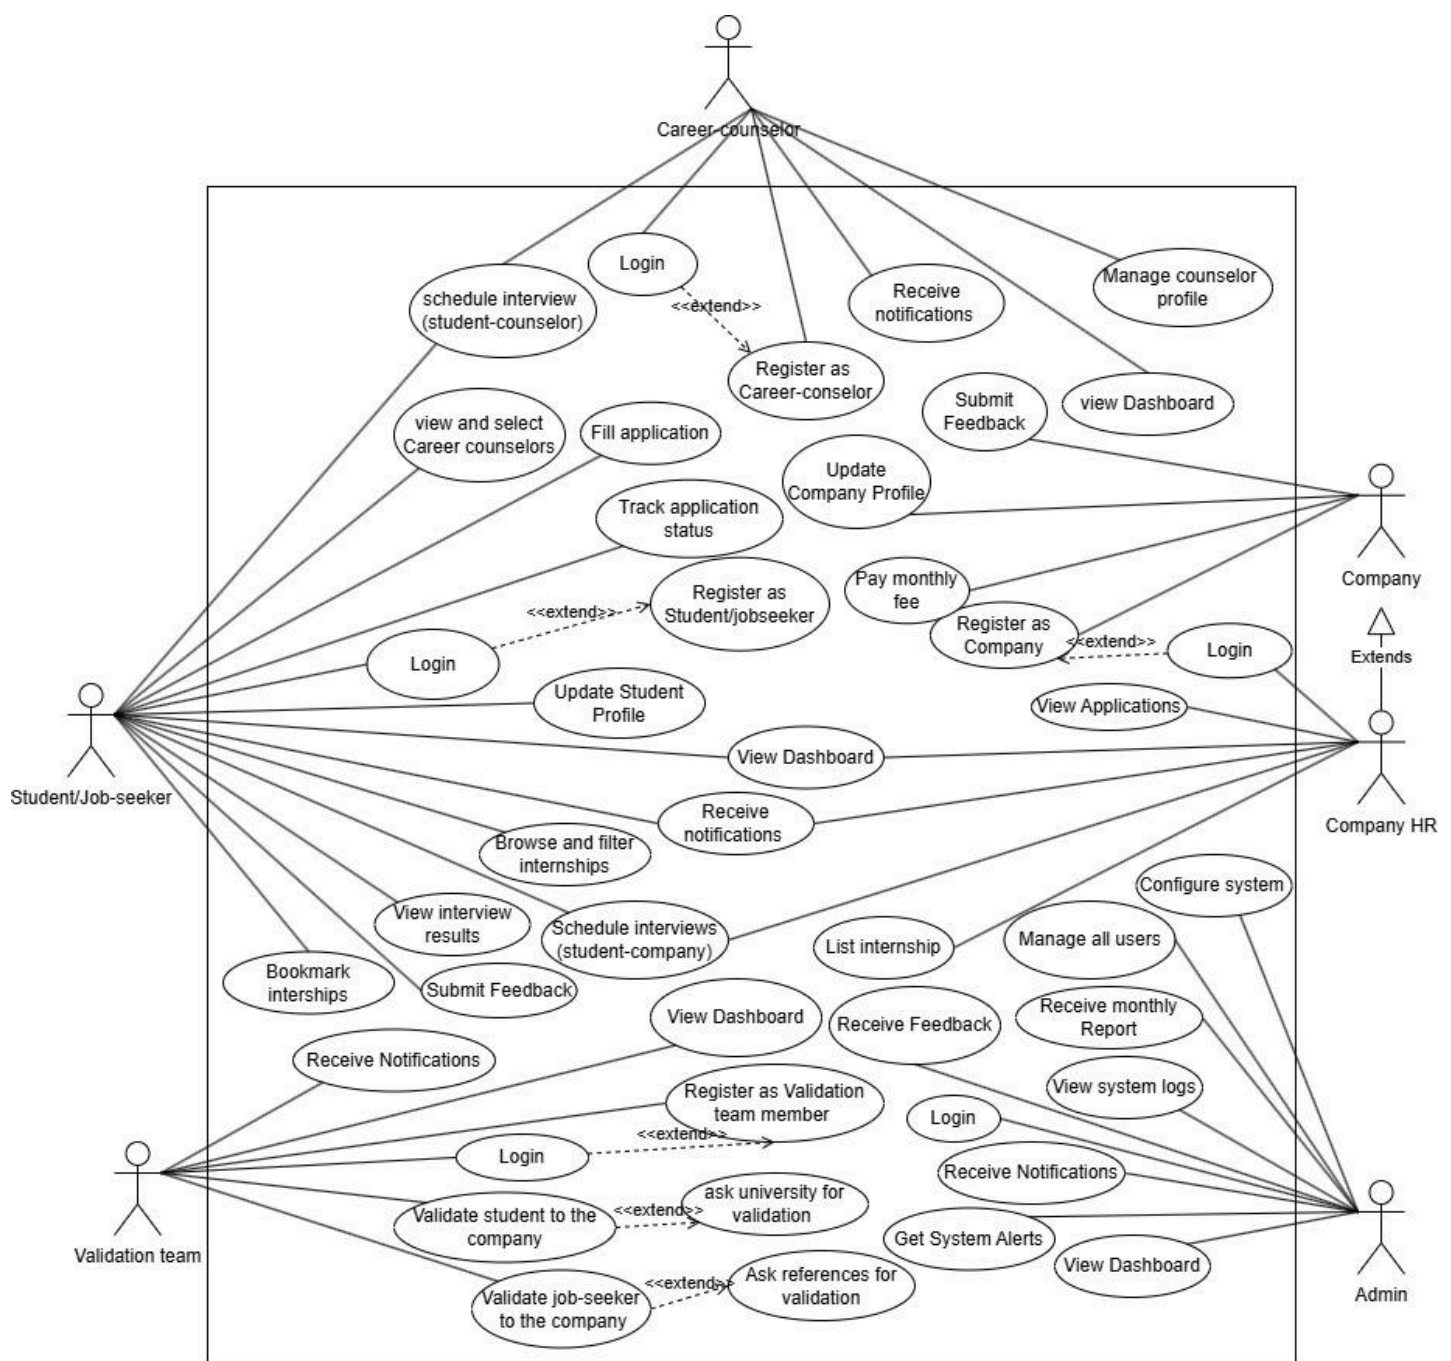

4.4 System Workflow

1. User interacts with the system through the UI (View)
2. Request is sent to the Controller
3. Controller processes the request and invokes Model methods
4. Model communicates with the database
5. Data is returned to Controller
6. Controller updates the View with relevant data

This flow ensures modularity and efficient request handling.

5. System Design Diagrams

5.1 Use Case Diagram

The Use Case Diagram represents interactions between system actors and functionalities.

Actors:

- Candidate
- Company HR
- Career Counselor
- Validator
- Admin

Use Cases:

- Register/Login
- Manage Profile
- Upload CV
- Apply for Jobs
- Post Job Listings
- Schedule Interviews
- Validate Documents
- Generate Reports

5.2 Class Diagram

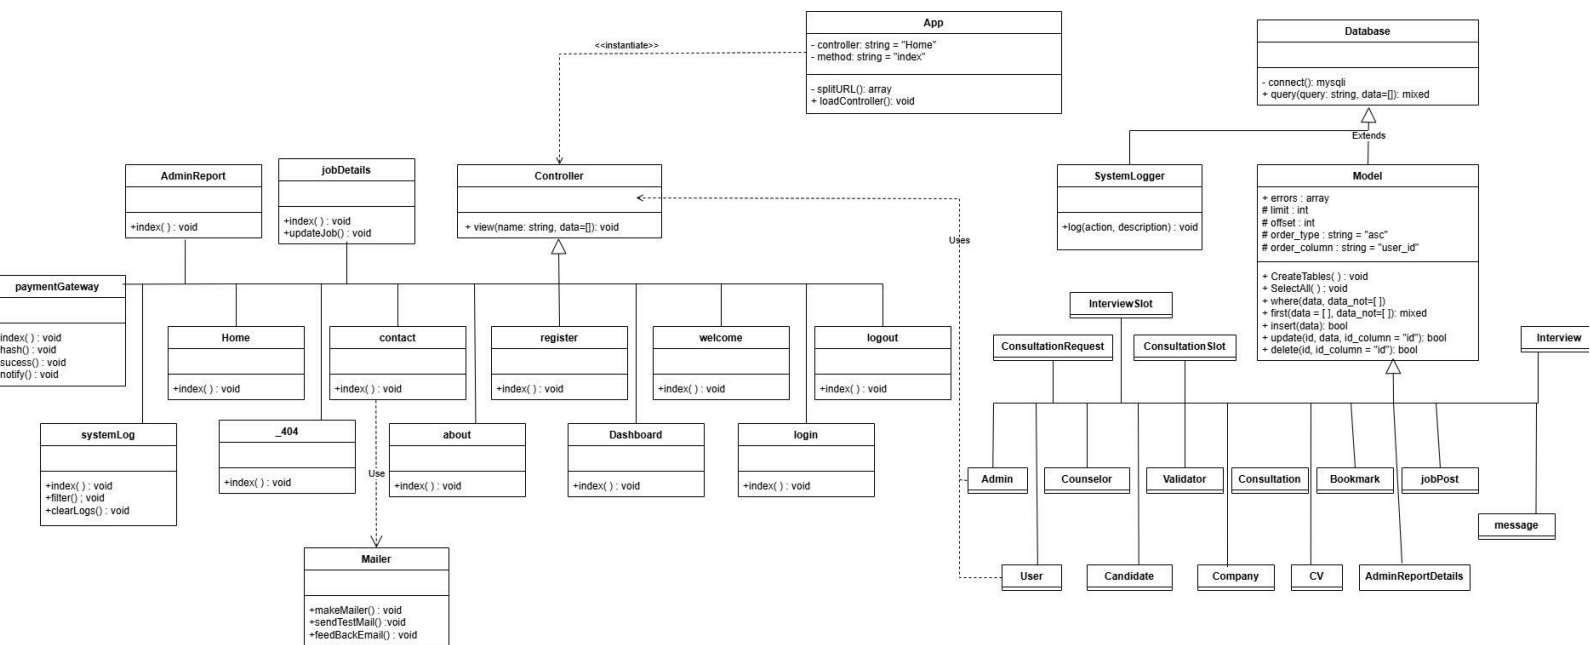

The Class Diagram illustrates system structure and relationships between entities.

Main Classes:

- User (Base class)
- Candidate, Counselor, Company, Validator, Admin (inherit from User)
- JobPost
- Application
- CV
- Interview

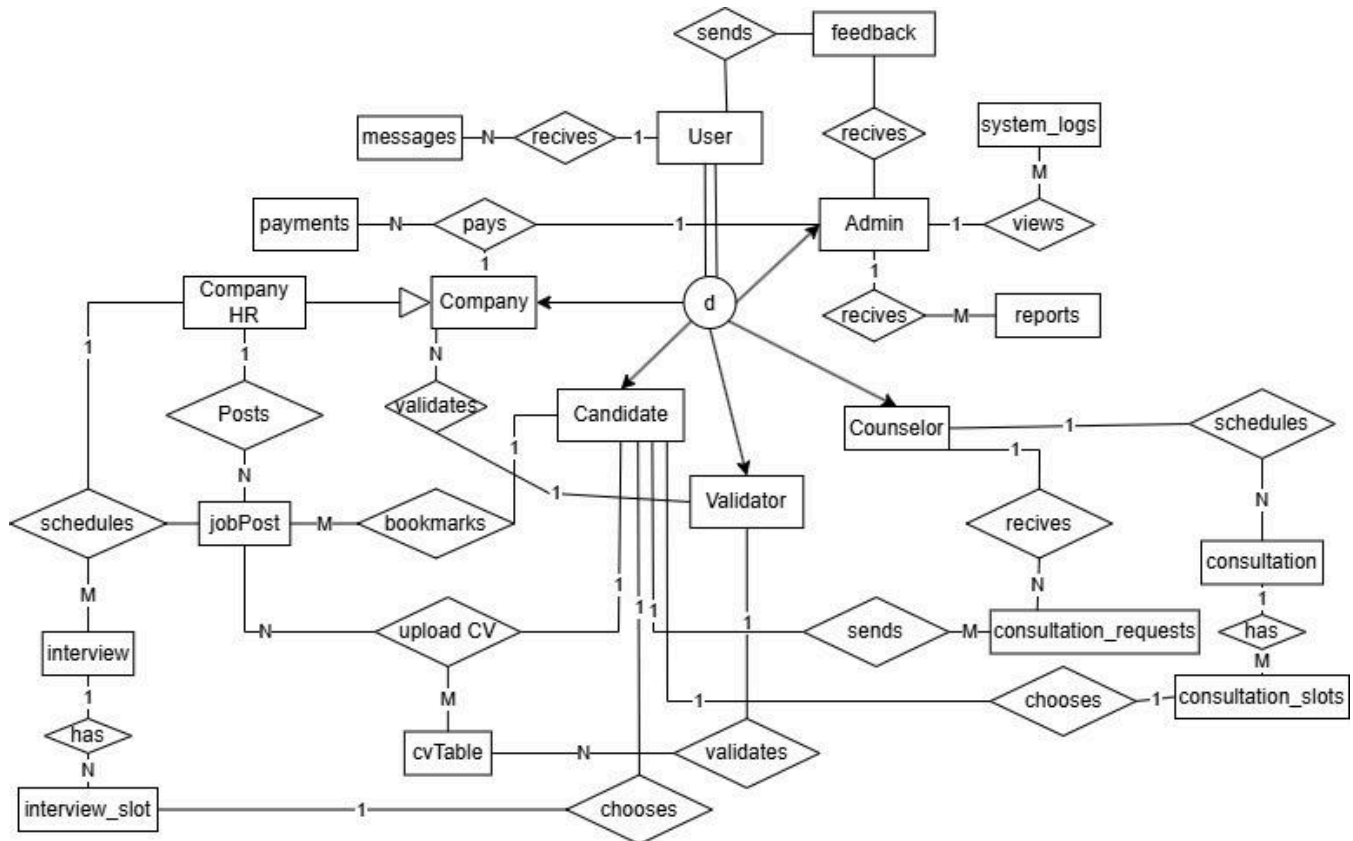

Relationships:

- Candidate → applies → JobPost
- Company → creates → JobPost
- Application → links Candidate & JobPost
- Interview → linked to Application
- Validator → verifies → Candidate/Company

5.3 ER Diagram

The Entity-Relationship Diagram represents database design.

**Entities:**

- Users
- Candidates
- Companies
- Admin
- Validators
- Counselors
- JobPosts
- Applications
- Interviews
- Consultation
- Consultation_request
- Messages
- CVtable

Primary and foreign keys are used to maintain referential integrity.

5.4 Activity Diagrams

5.4.1 Authentication Process

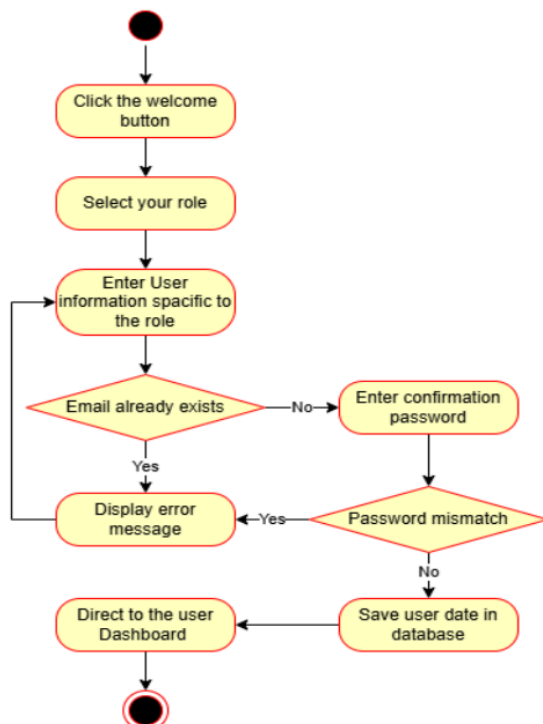

Fig1: registration

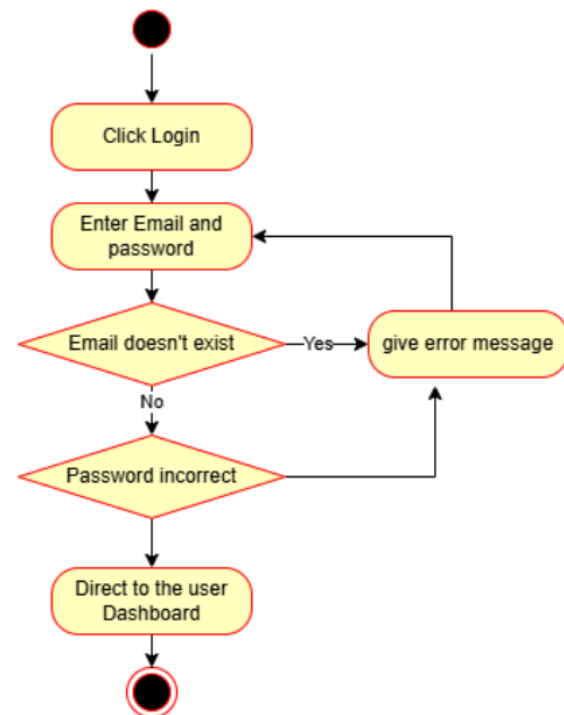

Fig2: login process

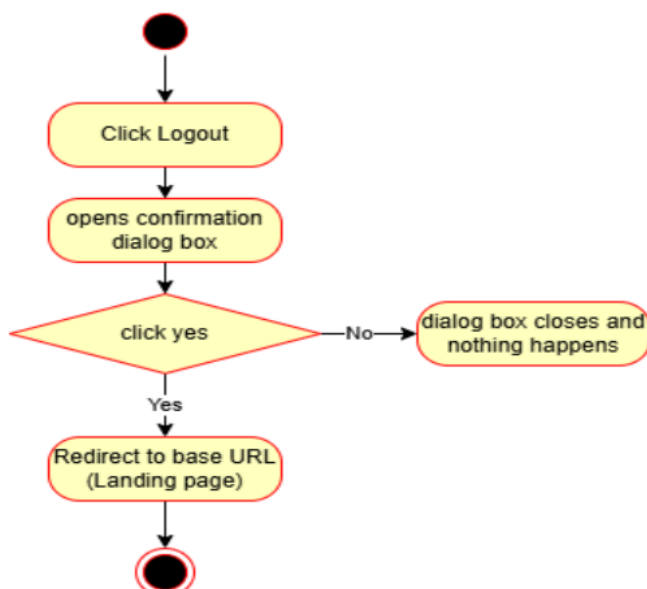

Fig3: logout process

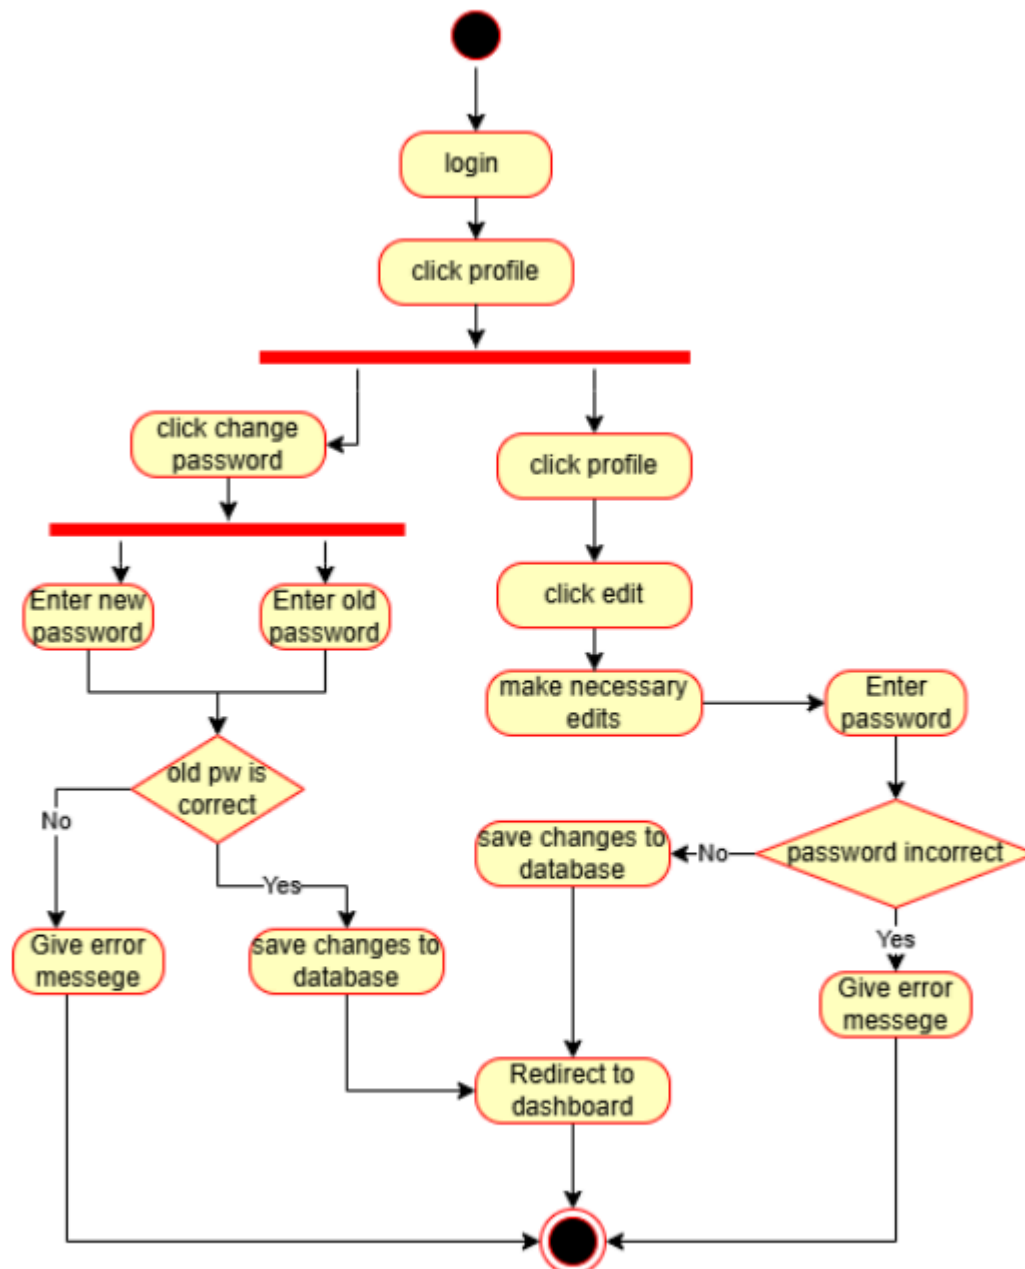

Fig4: profile and password changing processes

5.4.2 Hiring Process

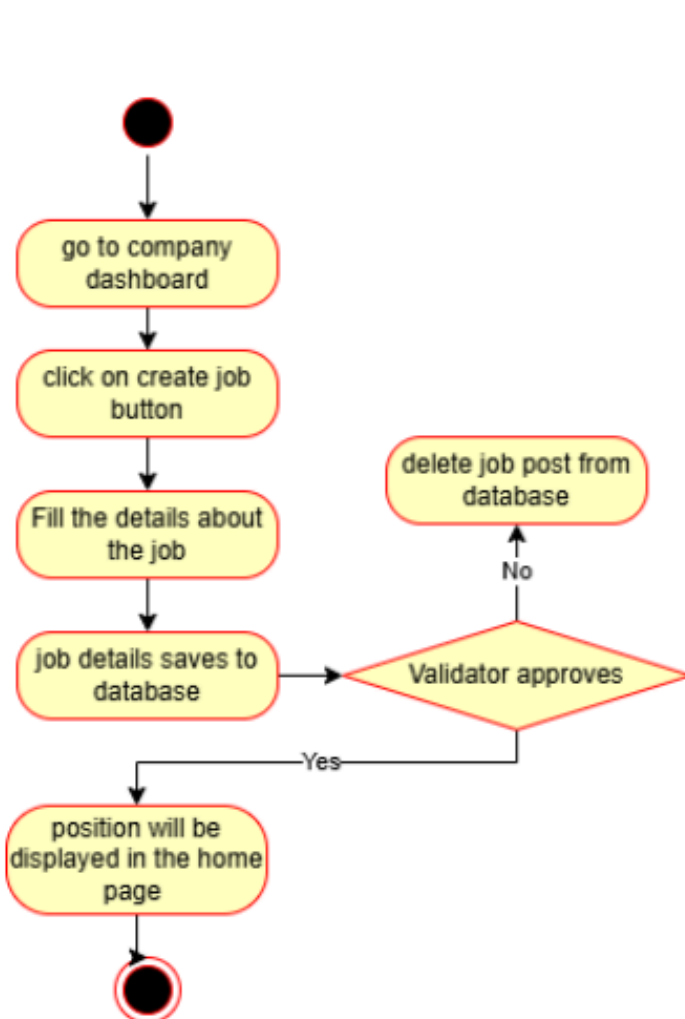

Fig5: Posting a job

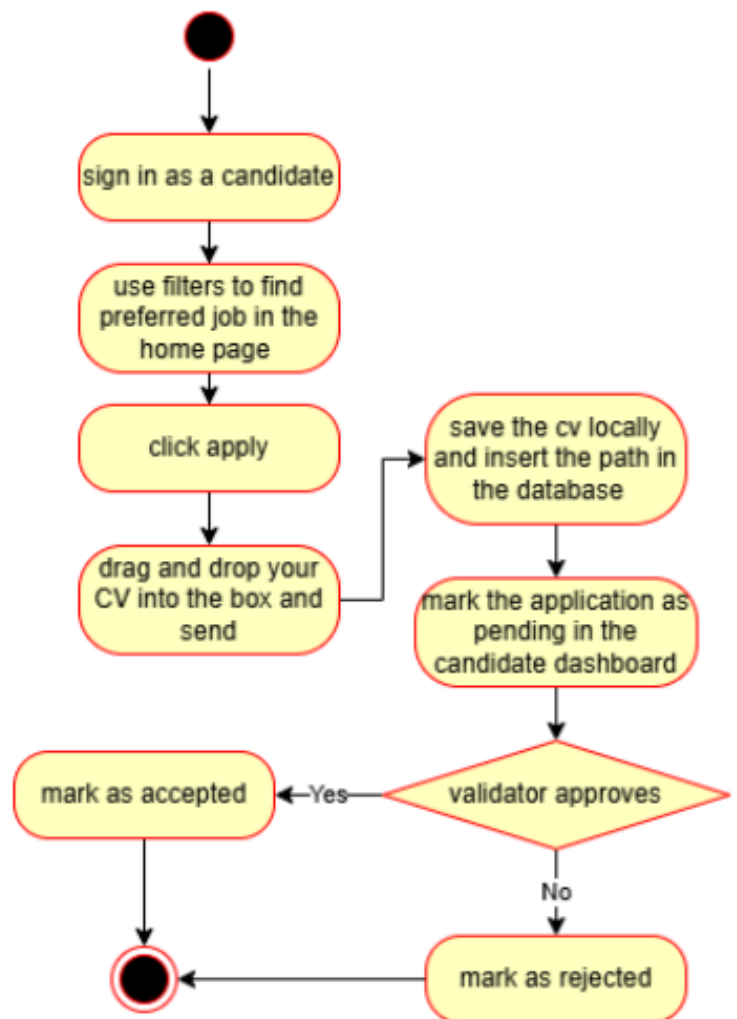

Fig6: applying for a job

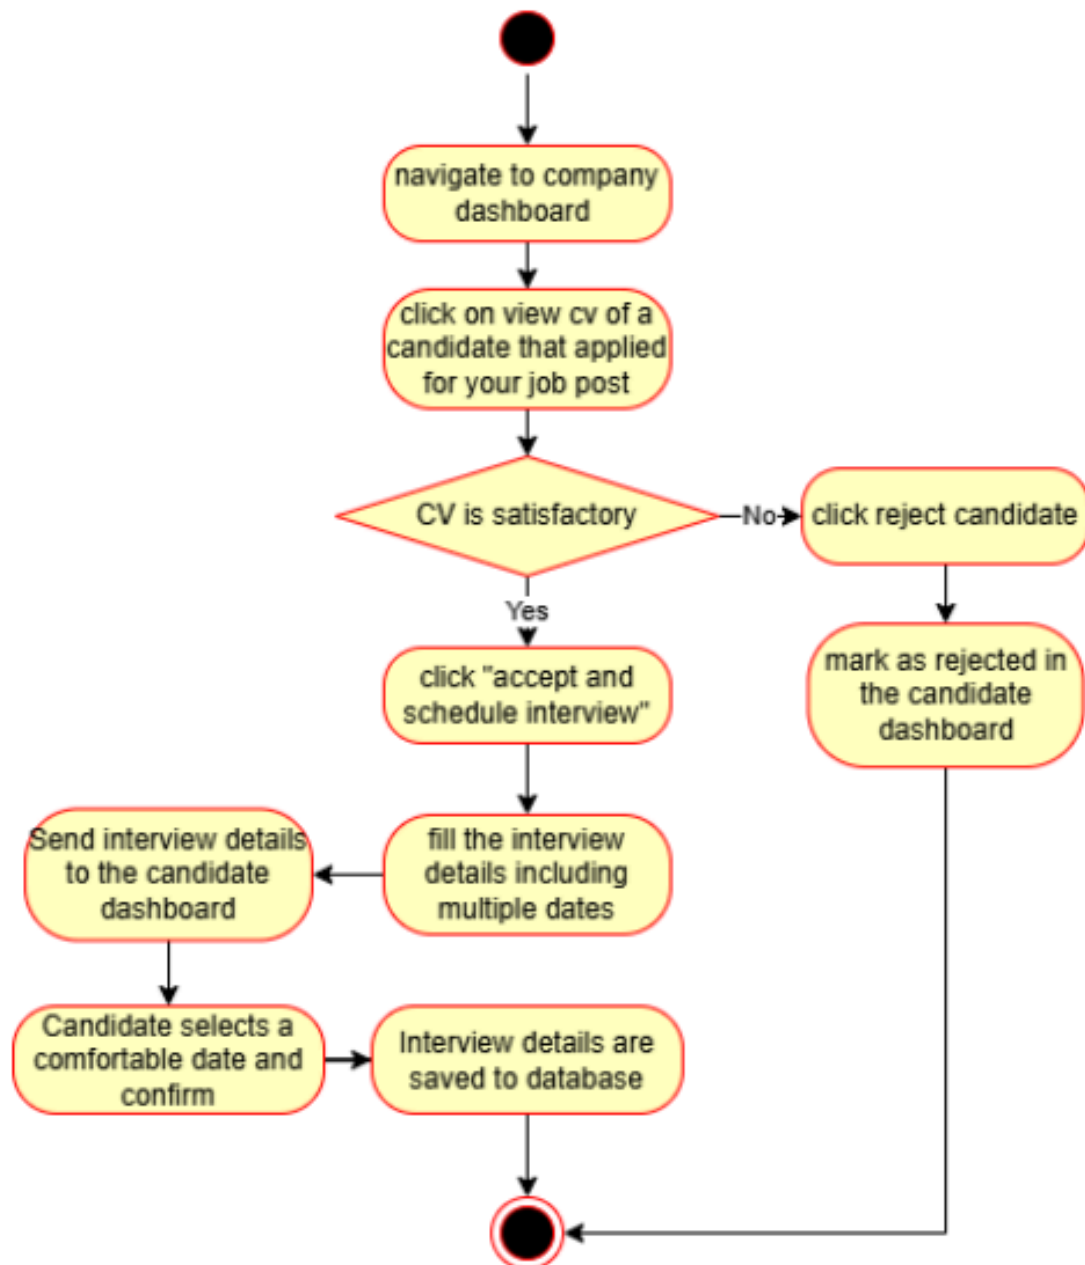

Fig7: interview scheduling process

5.4.3 Counselling Process

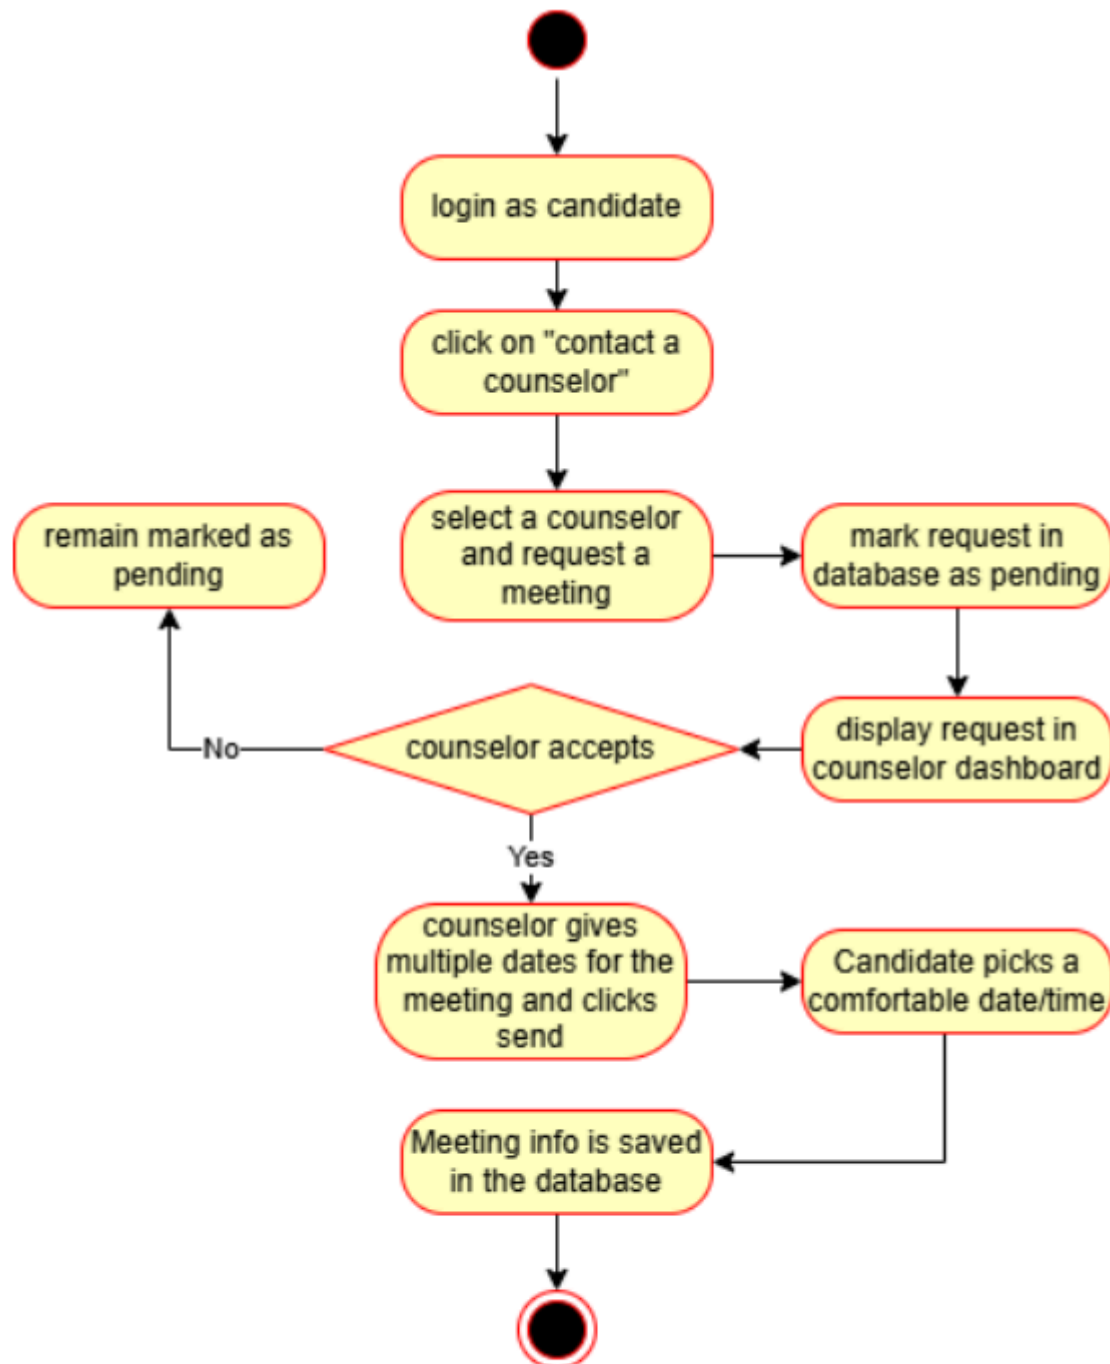

Fig8: scheduling meeting with a counselor

6. Completeness of the Project

6.1 Functionalities Completed

- User authentication and role-based access control for all five user roles.
- Profile management system for students, companies, and counselors.
- Basic dashboards for all roles (Candidate, Company HR, Counselor, Validator, Admin).
- Database schema design and all entity relationships.
- Responsive UI implementation for both mobile and desktop screen sizes.
- Job posting and application management system.
- Consultation request and scheduling system (student-counselor).
- Feedback posting and email notification system via PHPMailer.
- Report generation (monthly and on-demand).
- System logs page with filtering capabilities.
- Messaging system between users.
- Validator dashboard for reviewing and approving company/candidate submissions.
- Company-client interview scheduling system.
- Homepage job filters.

6.2 Functionalities Yet to be Completed

The system is functionally complete. The only remaining task is deployment:

- Hosting the system on an actual live domain rather than running it on a local XAMPP server.

6.3 Individual Contribution of Team Members

The table below summarises each team member's assigned modules and their overall percentage contribution to the project.

Anuk Thotawatta - 23002085

Contribution percentage :

Features :

- Home page Job filters
- Admin dashboard System logger
- Admin dashboard report Generation system
- Validator registration page
- Candidate-Company Interview scheduler
- Company Payment gateway
- Database template and functions for basic CRUD operations
- Admin dashboard System log page and its filters
- Admin Dashboard profile and password editor
- Validator Dashboard profile and password editor
- Validator Registration form
- Company Validation system
- Candidate CV validation system
- Bookmarking system for candidate
- Admin Dashboard System alerts for potential brute force attacks

Sanuth Wijayarathna - 23002263

Contribution percentage :

Features :

- Company Dashboard
- Company dashboard overview for jobs, candidates, and interviews
- Company profile and password management
- Company registration page
- Company job post creation and deletion system
- Notification message display system
- Admin alert notification display system
- Applied candidate filtering functionality
- Upcoming interview filtering functionality

Hiruni Ravindya - 23001615

Contribution percentage :

Features :

- Admin Dashboard user management system
- candidate dashboard
- candidate registration
- About us page
- jobDescription page
- Editing job post

Modules / Controllers :

- Candidate Dashboard controller
- jobPost controller

Additional Contributions :

- counting boxes in all dashboards
- Registration form css

Saraniya Thavakumar - 23001781

Contribution percentage :

Features :

- Contact Us page with form handling and validation
- Email functionality using PHPMailer
- Counselor Dashboard interface and functionality
- Student-Counselor Consultation Scheduling window
- User feedback management system
- Backend logic for handling user inquiries and responses

6.4 Test cases

The following sections detail the specific functionalities completed by each member, along with the test cases executed to verify each feature.

6.4.1 Test cases (Anuk Thotawatta)

- **Home page job filters**

Scenario	Steps	Expected Behavior	Pass/Fail
Sort by Salary range	Add a min and max salary and hit apply filters	Display the jobs that has the salary listed within the min and max salary range	pass
Sort by Ascending / Descending / Highest / Lowest	Pick 1 from Ascending, Descending, Highest, Lowest and hit apply filters	Order the jobs according to the picked setting	pass
Sort by city	Pick one of the available cities and hit apply filters	List the jobs that are from the picked city	pass
Sort by Work mode	Pick remote, on-site, or hybrid and click apply filters	List the jobs that are	pass
Sort by Job type	Pick intern, full-time, part-time, contract or freelance and apply filters	List the jobs that have the picked work mode	pass
Sort by Experience	Pick entry, mid, or senior and click apply filters	List the jobs that have the picked experience level	pass
Use multiple filters at the same time	Pick an 2 or more filters and hit apply	List the jobs that are within those filters	pass
Use no filters	Just clicking the apply filters button with the filters at their defaults	Display all available jobs	pass

● Admin dashboard system logger

Scenario	Steps	Expected Behavior	Pass/Fail
View all system logs	Navigate to admin dashboard and open system log page	Display all system logs in chronological order	pass
Filter logs by date range	Pick either today, this month or this year	Display only the logs that fall within the selected range	pass
Filter logs by role type	Select a specific role to filter	Display the actions only taken by the selected role	pass
Clear all system logs	Navigate to the top of the system logs page and click the clear logs button	Delete all system logs from the database	pas

● Admin dashboard report Generation system

Scenario	Steps	Expected Behavior	Pass/Fail
Auto Generate monthly report	Wait for the start of a new month and look at the view monthly reports box	A new report should appear and when clicked Open report in different tab lists the values of things that happened this month	pass
Generate on-demand report	Navigate to admin dashboard and click generate report	Opens report page in different tab and shows report of thing happened the past 30 days	pass
Filter reports	Go to the monthly reports box and select a year to view reports	Show the reports that were generated in that selected year	pass

● Validator registration page

Scenario	Steps	Expected Behavior	Pass/Fail
Submit registration form with empty email	Navigate to registration form, leave email empty, fill other fields correctly, click register	Alert saying "please fill out this field" (email)	pass
Submit registration with invalid email format	Navigate to registration form, enter "usergmail.com", fill other fields, click register	Error message saying "please enter a valid email address"	pass
Submit registration with empty password	Navigate to registration form, enter valid email, leave password empty, fill others, click register	Alert saying "please fill out the password field"	pass
Submit registration with password mismatch	Navigate to registration form, enter password "123456", confirm password "12345", click register	Error message saying "passwords do not match"	pass

Submit registration with already registered email	Navigate to registration form, enter an existing email, fill others correctly, click register	Error message saying "email already registered"	pass
Successful registration with valid data	Navigate to registration form, enter valid email, strong password, matching confirm password, click register	Redirect to login page or show "registration successful" message	pass

● Candidate-Company Interview scheduler

Scenario	Steps	Expected Behavior	Pass/Fail
Candidate sends the cv to the company	Click on the job post. Click on apply for a job. Drag and drop cv and send. validator receives the cv. Checks its legitimacy and accepts or rejects. If accepted the company receives the cv	The CV alongside with the candidate information shows up in the applied candidates box in the company Dashboard	pass
Company rejects or accepts	The company HR navigates to the applied candidates box. View CV and click accept or reject	If accepted. The interview scheduler pops up. If rejected the status of the cv will be marked as rejected in the candidate dashboard.	pass
Company sending time slots to the candidate	After the interview scheduler pops up, enter interview details such as medium, address and extra details, insert 1 or more dates/times. And click send	The sent CV is marked as Accepted in the company dashboard. And now is clickable and once clicked the candidate side interview scheduler pops up	pass
Candidate confirming date	After candidate side interview scheduler pops up candidate will choose a comfortable time and click confirm	The entry will be removed from the sent applications box and a new entry will appear in the upcoming interviews box	pass

● Company Payment gateway

Scenario	Steps	Expected Behavior	Pass/Fail
Submit valid payment	Enter valid card details and click pay	Payment is processed successfully and confirmation is displayed	pass
Submit with empty fields	Leave payment fields empty and click pay	Alert saying please fill out this field	pass
Submit with invalid card number	Enter an invalid card number and click pay	Error message saying invalid card details	pass

Submit with expired card	Enter an expired card date and click pay	Error message saying card has expired	pass
--------------------------	--	---------------------------------------	------

● Admin Dashboard profile and password editor

Scenario	Steps	Expected Behavior	Pass/Fail
Edit profile with valid data	Navigate to admin profile,click profile, click edit profile, update fields with valid data, enter password and save	Changes are saved and profile is updated	pass
Edit profile without changing anything	Navigate to admin profile,click profile, click edit profile, enter confirmation password and save	Nothing changes in the profile	pass
Change password with correct old password	Enter correct old password, new password and matching confirm password, click save	Password is updated successfully	pass
Change password with wrong old password	Enter incorrect old password and click save	Error message saying incorrect password	pass
Change password with mismatched new passwords	Enter new password and a different confirm password, click save	Error message saying passwords do not match	pass

● Validator Dashboard profile and password editor

Scenario	Steps	Expected Behavior	Pass/Fail
Edit profile with valid data	Navigate to admin profile,click profile, click edit profile, update fields with valid data, enter password and save	Changes are saved and profile is updated	pass
Edit profile without changing anything	Navigate to admin profile,click profile, click edit profile, enter confirmation password and save	Nothing changes in the profile	pass
Change password with correct old password	Enter correct old password, new password and matching confirm password, click save	Password is updated successfully	pass
Change password with wrong old password	Enter incorrect old password and click save	Error message saying incorrect password	pass
Change password with mismatched new passwords	Enter new password and a different confirm password, click save	Error message saying passwords do not match	pass

● Validator Registration form

Scenario	Steps	Expected Behavior	Pass/Fail
Submit registration form with empty email	Navigate to registration form, leave email empty, fill other fields correctly, click register	Alert saying "please fill out this field" (email)	pass
Submit registration with invalid email format	Navigate to registration form, enter "usergmail.com", fill other fields, click register	Error message saying "please enter a valid email address"	pass
Submit registration with empty password	Navigate to registration form, enter valid email, leave password empty, fill others, click register	Alert saying "please fill out the password field"	pass
Submit registration with password mismatch	Navigate to registration form, enter password "123456", confirm password "12345", click register	Error message saying "passwords do not match"	pass

● Company Validation system

Scenario	Steps	Expected Behavior	Pass/Fail
Approve a registered company	Navigate to validator dashboard, select a pending company, review details and click approve	Company is marked as approved and can fully access the platform	pass
Reject a registered company	Select a pending company, review details and click reject	Company is marked as rejected and notified	pass
View company details before validating	Click on a pending company profile in the validator dashboard. And click on the view business certificate button	Full company details and business certificate are displayed for review	pass
Company attempts to post job before validation	Company logs in after first registering and navigates to the Create new position box	The button is not clickable and the text says waiting for validator approval	pass

● Candidate CV validation system

Scenario	Steps	Expected Behavior	Pass/Fail
View CV before validating	Click on a pending CV in the validator dashboard	Full CV is displayed for review	pass
Approve a candidate CV	Navigate to validator dashboard, select a pending CV, review and	CV is marked as approved and visible to companies	pass

	click approve		
Reject a candidate CV	Select a pending CV, review and click reject	CV is marked as rejected and candidate is notified	pass

- **Bookmarking system for candidate**

Scenario	Steps	Expected Behavior	Pass/Fail
Bookmark a job	Navigate to a job listing and click the bookmark icon	Job is saved to the candidate's bookmarks	pass
Remove a bookmark	Click the bookmark icon on an already bookmarked job	Job is removed from the candidate's bookmarks	pass
View bookmarked jobs	Navigate to candidate dashboard and open bookmarks section	All bookmarked jobs are displayed	pass

- **Admin Dashboard System alerts for potential brute force attacks**

Scenario	Steps	Expected Behavior	Pass/Fail
Trigger brute force alert	Attempt to login as from an existing account and enter the incorrect password more than 3 times	A security alert is generated in the system log and displayed in the admin dashboard	pass
View alert details	Click on a brute force alert in the admin dashboard	Alert details including user, number of attempts, and timestamp are displayed	pass
Dismiss an alert	Click dismiss on a resolved alert	Alert is removed from the dashboard	pass

6.4.2 Test cases (Sanuth Wijayarathna)

- **Company Dashboard**

-

Scenario	Steps	Expected Behavior	Pass/Fail
Submit login form with empty email	Navigate to login field, leave email empty, only enter	Alert saying please fill out this field	pass

	password, click login		
Submit login form with invalid email format	Navigate to login field, enter email as admin@gmailcom, enter password, click login	Error message saying email doesn't exist. Because the site would not let you register with a invalid email	pass
Submit login with empty password	Navigate to login field, enter a correct email that exists in the system, leave the password blank	Alert saying please fill out the password field	pass

6.4.3 Test cases (Hiruni Ravindya)

- **Log-In**

Scenario	Steps	Expected Behavior	Pass/Fail
Submit login form with empty email	Navigate to login field, leave email empty, only enter password, click login	Alert saying please fill out this field	pass
Submit login form with invalid email format	Navigate to login field, enter email as admin@gmailcom, enter password, click login	Error message saying email doesn't exist. Because the site would not let you register with a invalid email	pass
Submit login with empty password	Navigate to login field, enter a correct email that exists in the system, leave the password blank	Alert saying please fill out the password field	pass

6.4.4 Test cases (Saraniya Thavakumar)

- **Contact Us Page**

Scenario	Steps	Expected Behavior	Pass/Fail
----------	-------	-------------------	-----------

Submit valid feedback	Enter valid name, email, message and click submit	Feedback is saved and success message is displayed	pass
Empty name	Leave name field empty and submit	Show error: "Name must be between 2 and 80 characters."	pass
Name too short	Enter 1 character in name and submit	Show error: "Name must be between 2 and 80 characters."	pass
Name too long	Enter more than 80 characters and submit	Show error: "Name must be between 2 and 80 characters."	pass
Invalid email format	Enter incorrect email (e.g., abc@) and submit	Show error: "Please enter a valid email address."	pass
Email too long	Enter email more than 120 characters	Show error: "Please enter a valid email address."	pass
Empty message	Leave message field empty and submit	Show error: "Message must be between 5 and 3000 characters."	pass
Message too short	Enter less than 5 characters	Show error: "Message must be between 5 and 3000 characters."	pass
